

Summary of my research activities

M. Katsuma

Nuclear reactions

Nuclear reaction theory Low-energy nuclear reaction relevant to astrophysics [1-3][8]

- Theoretical $^{12}\text{C}(\alpha,\gamma)^{16}\text{O}$ reaction rates are calculated.

Nuclear rainbow phenomena [5,6,16,21]

- Scrutinized the nuclear interaction potential between ^{16}O - ^{16}O nuclei.
- Investigated molecular resonance for the $^{16}\text{O}+^{16}\text{O}$ system at low energies, in the consistent description with the nuclear rainbow.

Molecular resonances [9,17-19]

- Tried to describe the molecular resonance for the $^{16}\text{O}+^{16}\text{O}$ system, with microscopic coupled-channel method.

Spin polarization [7]

- Examined the possibility of the spin-orbit part of the microscopic folding model for ^3He , and predicted the experimental results for spin-polarization.

Nuclear data

Reaction rates for astrophysics: NACRE (Brussels) [10-13]

- Worked for an update and extension project of nuclear reaction rate library (NACRE), was in charge of the development of a code package evaluating low-energy nuclear reactions relevant to nuclear astrophysics.
- Proposed the re-consideration of the contribution from the direct mechanism using the direct capture potential model and distorted wave Born approximation (DWBA).

Charged particle nuclear reactions: NRDF, EXFOR (Hokkaido Univ.) [4,14,15,20]

- Developed a web application of a calculator of elastic scattering cross section.
- Tried to establish an evaluation method for mass fragmentation of the high-energy proton induced reactions in the development of the accelerator driven nuclear reactors.
- Engaged in the assistance of the construction and design of nuclear reactors with accelerator-driven transmutation system for the next generation.
