## The plan of our study

Every link can be realized as a closed braid. A. Kawauchi suggested the following project: enumerate the prime links by using the braid expressions and enumerate the closed connected orientable 3-manifolds by using the prime link table. We have enumerated the 3-manifolds with lengths up to 10, according to this project.

We describe the outline of the project. A well-order (called a *canonical order*) was introduced on the set of links by A. Kawauchi [K] (see also A. Kawauchi and I. Tayama [KT1]).

We assign to every link a lattice point whose length is equal to the minimal crossing number on closed braid forms of the link and we call the number the *length* of the link. We note that a link $L$ is smaller than a link $L'$ in the canonical order if the length of $L$ is smaller than that of $L'$, and for any natural number $n$ there are only finitely many links with lengths up to $n$. Let $\mathbf{L}^p$ be the set of prime links and $\mathbf{M}$ the set of closed connected orientable 3-manifolds. Let $\chi : \mathbf{L}^p \to \mathbf{M}$ be a map defined by $\chi(L) = \chi(L, 0)$ (that means the result of the 0-surgery on $S^3$ along $L$). Then it is known that $\chi$ is surjective and A. Kawauchi defined a map $\alpha : \mathbf{M} \to \mathbf{L}^p$ by $\alpha(M) = \min\{L \in \chi^{-1}(M) : \ L' \in \chi^{-1}(M), \pi_1(E(L)) = \pi_1(E(L')) \Rightarrow L \leqq L'\}$ for $M \in \mathbf{M}$, where $E(L)$ is the exterior of $L$. By using $\alpha$, we consider $\mathbf{M}$ as a subset of $\mathbf{L}^p$ and introduce the well-order into $\mathbf{M}$.

As we said, we have completed the table of 3-manifolds with lengths up to 10. There are two plans for our study:

(1) we enumerate the 3-manifolds with lengths up to 11,

(2) we enumerate special manifolds with lengths up to a large number.

According to the second plan, we enumerate the homology spheres until Poincare sphere appears.
